Supplementary Figure 1. Functional activity of fluorescent derivatives of initiation factors. 70S IC were formed with f[3H]Met-tRNAfMet and mRNA (m022) in the absence of the respective factor (white bars), in the presence of the respective unmodified (wt) factor (grey bars), or with fluorescence-labeled mutant initiation factor (black bars). The extent of complex formation was determined by nitrocellulose filtration.
Supplementary Figure 2. Time courses of IF and mRNA dissociation. (a) Chase of IF1 from 30S complexes with IF2 or IF3 or IF2 + IF3. Complexes were formed using 30S subunits (0.05 µM), IF1$_{4}$ (Alx555) (0.5 µM), IF3$_{166}$ (Alx488) (0.06 µM), IF2 (0.15 µM) or IF2$_{757}$ (Alx488) (0.11 µM), GTP (0.25 mM), as indicated; the dissociation was initiated by the addition of unlabeled IF1 (5 µM). (b) Chase of IF2$_{599}$ (Atto465) from various 30S complexes was initiated by the addition of unlabeled IF2 (1.5 µM). 30S complexes (0.05 µM) were prepared with IF2$_{599}$ (Atto465) (0.11 µM), GTP (0.25 mM) in the absence or presence of IF1 (1 µM), IF3$_{166}$ (Alx555) (0.1 µM), mRNA (0.4 µM). (c) Chase of IF3. Complexes were formed by incubating 30S subunits (0.1 µM) with IF3$_{166}$ (Alx488) (0.01 µM), and mRNA (0.4 µM) and where indicated IF1 (1 µM), IF2 (0.3 µM) with GTP (0.25 mM), and fMet-tRNA$_{fMet}$ (0.3 µM). The dissociation was initiated by addition of unlabeled IF3 (1 µM) to the 30S complex containing the FRET pair. (d) Chase of mRNA (Atto488) from 30S-mRNA complexes by excess of unlabeled mRNA. The dissociation of the fluorescent mRNA from the complexes (0.05 µM) was initiated by addition of unlabeled mRNA (1.5 µM).
Supplementary Figure 3. IF1 binding to 30S:IF3 complex in the presence or absence of mRNA. IF1(Alx555) (0.15 μM) was rapidly mixed with 30S subunits (0.05 μM) in complex with IF3(Alx488) (0.06 μM) in the absence or presence of mRNA (0.3 μM). Lower line, control without ribosomes.
Supplementary Figure 4. Concentration dependence of $k_{\text{app}1}$ and $k_{\text{app}2}$ values of IF3 binding to 30S complexes. (a) Linear dependence of $k_{\text{app}1}$ values. (b) Hyperbolic dependence of $k_{\text{app}2}$ values. The estimations of the elemental rate constants were used as initial parameters for global fitting. Experimental conditions are indicated in Fig. 4. Symbols: (■) 30S subunit; (●), with IF1; (▲) with IF2; (□) with IF1 and IF2.
Supplementary Figure 5. Binding, conformation and functional activities of mRNAs. (a) Mobility of mRNAs on a non-denaturing PAGE. 10 pmol of each fluorescent mRNA were loaded onto the gel after renaturation in the presence or absence of 7 mM magnesium acetate. Gels were run for 2.5 h at 4°C in TBE buffer and scanned using F7000 scanner with a fluorescence filter for Cy2 (GE Healthcare). (b) Time courses of mRNA(m022) binding to vacant 30S subunits, 30S with IF1, IF2, and IF3 (30S-IFs), or to the 30S-IFs-fMet-tRNA^{fMet}
complex; topmost curve, control without ribosomes. Complex formation was monitored by the fluorescence change of Atto488 attached to position +12 of the mRNA. In the presence of the highly structured m6a mRNA\(^1\), no fluorescence intensity change was recorded (not shown) indicating that the signal observed for the other mRNAs originate from the association of single stranded segments of the constructs\(^1\). (c) 30S IC and dipeptide formation with mRNAs used in this study. The amount f\(^{3}\)H\]Met-tRNA\(^{\text{Met}}\) bound to the 30S subunits was measured by nitrocellulose filtration and liquid scintillation counting. The relative values indicate efficiencies of fMet-tRNA\(^{\text{Met}}\) recruitment for each mRNA normalized by the efficiency obtained when m002 mRNA was used, typically between 80-100%. Dipeptide formation was measured after addition of 50S subunits, EF-Tu, GTP, \(^{14}\)C\]Phe-tRNA\(^{\text{Phe}}\), phosphoenol pyruvate, and pyruvate kinase to the 30S IC as described\(^2\). Relative efficiency values were calculated as for 30S IC formation measurements.
