General: All reactions were carried out in flame-dried glassware under Ar. The solvents were purified by distillation over the drying agents indicated and were transferred under Ar: THF, Et₂O (Mg-anthracene), CH₂Cl₂, CHCl₃, MeCN, Et₃N, Me₂NH, MeNO₂ (CaH₂), MeOH (Mg), hexane, toluene (Na/K). IR: Nicolet FT-7199 spectrometer, wavenumbers in cm⁻¹. MS (EI): Finnigan MAT 8200 (70 eV), ESI-MS: Finnigan MAT 95, accurate mass determinations: Bruker APEX III FT-MS (7 T magnet). NMR: Spectra were recorded on a Bruker DPX 300, AV 400 or AV 600 spectrometer in the solvents indicated; ¹H and ¹³C chemical shifts (δ) are given in ppm relative to TMS, coupling constants (J) are given in Hz and are not averaged; aromatic systems were invariably analyzed as ‘first order’ coupling pattern. The solvent signals were used as references and the chemical shifts converted to the TMS scale. Melting points: Büchi melting point apparatus B-540 (corrected). Elemental analyses: H. Kolbe, Mülheim/Ruhr. All commercially available compounds (Acros, Fluka, Lancaster, Aldrich) were used as received unless stated otherwise.
Starting Materials

The chloro vinamidinium salts 3, 6, 10, 12 and 14 were prepared in analogy to literature procedures as described below:

Once the addition was complete, the mixture was stirred for 6 h at ambient temperature before it was poured into a sat. aq. solution of NaBF₄. The organic layer was separated, dried over MgSO₄ and evaporated to give compound 3 as a yellow solid (5.72 g, 44%). ¹H NMR (400 MHz, CD₂Cl₂): δ = 7.43 (s, 1H), 4.04 (t, J = 8.8 Hz, 2H), 3.36 (t, J = 8.8 Hz, 2H), 3.32 (s, 3H), 3.29 (s, 3H), 3.27 ppm (s, 3H); ¹³C NMR (100 MHz, CD₂Cl₂): δ = 163.5, 153.5, 101.7, 55.4, 48.7, 39.9, 36.1, 25.6 ppm; MS (ESI+): m/z (%): 173.0 (100).

Solution by direct methods (SHELXS-97), refinement by full-matrix least-squares on $F^2$ (SHELXL-97), H atoms riding. The crystal was non-merohedrally twinned [-1 0 0 0 -1 0 0 -1 2]. The methylene group of the solute dichloromethane is disordered over two positions with an occupancy of 0.6:0.4. Disordered atoms were refined with isotropic atomic displacement parameters. The standard uncertainties of the Pd atom parameters are probably underestimated, which results in high standard uncertainties in the differences of the components of the anisotropic displacement parameters along the Pd1-P1 and Pd1-P2 bonds (Hirshfeld test). The relatively large anisotropy in the atomic displacement parameters for C8, C9, C10 and C11 indicate that either the associated N atoms are slightly pyramidal or there is some flexibility in these parts of the molecule. $R_1 = 0.045$ [$I > 2\sigma(I)$], $wR_2 = 0.125$ (all data), 554 parameters, $S = 1.072$, residual electron density $+2.8 / -2.3$ e Å$^{-3}$ (in the vicinity of Pd1).
